SIMPACK Drivetrain is an application primarily used for simulating drivetrains within the automotive, wind turbine and railway sectors, but can also be applied to any field of engineering where power transmission is required.

Applications
- System simulation of any embedded drivetrain design
- Resonance analysis
- Stochastic and transient response
- Gear whine and rattle
- Optimization
- Stress and durability analysis
- Hardware/software-in-the-loop

Highlights
- Simulation of any design
- Flexible gear wheels
- Extreme non-linear system behavior, e.g. emergency braking
- Acoustic analyses in the frequency and time domain
- Interfaces to third party software
- Numerous possible levels of fidelity
- Batch jobs and automatic analysis reports

Features
- Drivetrain specific elements:
  - Universal/Cardan and constant velocity elements
  - Bearings, elastomeric and hydro mounts
  - Gearboxes (gear shift, differential, planetary, etc.)
  - Detailed gear pairs (individual tooth contact)
  - Flywheels, clutches and synchromeshes
- Flexible body generation within SIMPACK
- Importation of flexible bodies from FEM codes
- Non-linear bending
- Easy implementation of user specific code
Interfaces to

- FEM software
- Control software
- CAD software
- CFD software
- Fatigue analysis software
- Aerodynamic codes
- Optimization tools

Operating Systems

- Windows and Linux.
